SUMMARY

Software engineering student (2028) who builds full-stack and embedded systems end to end. Built the multi-repository **SyncFit Edge** system — ESP32/PPG firmware, FastAPI backend, Next.js frontend and a constrained LLM kernel — and shipped **Legato** live on AWS. Currently co-designing a multi-agent ransomware detector for Windows.

SKILLS

Languages	C++ · C# · Python · Java · JavaScript · TypeScript · HTML/CSS
Frontend	React 19 · Next.js · Angular · Vite · Tailwind CSS · Zustand
Backend & data	FastAPI · NestJS · Spring Boot · Node.js · PostgreSQL · Firebase · REST · WebSockets
Embedded	ESP32 firmware · PPG, thermal and load-cell sensing (C++)
Testing	Pytest · Vitest · Playwright · Testing Library
Tools	Linux (Fedora, Arch, Kali, Ubuntu) · Docker · Git · GitHub Actions · LLM APIs and agent tooling

EXPERIENCE

Freelance Developer & Programming Mentor Pasto / remote **2025 – Present**

- Mentor students and junior developers in programming fundamentals, debugging and code review — teaching the reasoning instead of handing over the solution.
- Run frontend evaluations and introductory red-team exercises on client web apps, reporting findings with reproduction steps.

Sales Advisor Asgard GYM, Pasto **2025 – Present**

- Advise gym clients on memberships and services in person, turning objections into a recommendation.
- Own the client relationship after the sale, which is where my communication and client-care skills come from.

PROJECTS

SyncFit Edge — wearable + AI training adaptation syncfit-hardware ↗

- Architected a multi-repository system that adapts training load to menstrual and gestational phases: C++ ESP32/PPG firmware, FastAPI + WebSockets backend, PostgreSQL, Next.js frontend and a DeepSeek reasoning kernel.
- Constrained the model to strict JSON and published JSON Schema 2020-12 + OpenAPI 3.1 contracts consumed by firmware, backend and frontend alike.
- Gated every payload with fixtures, pytest and GitHub Actions across Python and TypeScript.

Legato — web music player for musicians legato.jenilarper.dev

- Shipped a React 19 + TypeScript player live on AWS (S3, CloudFront, ACM), with playlists, library and history on hand-written doubly linked lists and a live structure visualizer.
- Added Firebase sync with an offline-first IndexedDB fallback, Spotify import, i18n and drag-and-drop; covered core flows with Vitest and Playwright.

Multi-Agent Ransomware Detector — Windows · Sysmon · MITRE ATT&CK **in progress**

- Co-designing an on-host architecture where per-sensor agents read Sysmon telemetry and an orchestrator reconstructs the attack sequence with MITRE ATT&CK.
- Agents map evidence to ATT&CK and recommend a mitigation; benchmarked against a monolithic classifier in Windows 11 VMs.

Also **HayPaComer** (smart fridge with AI nutrition routines — Angular + NestJS, in progress) · **NitroRhythm** (Unity 6 arcade racer, individual, SENA) · **RiTech** (coffee and cacao traceability from Nariño to the EU)

EDUCATION

Software Engineering — Universidad Cooperativa de Colombia, Pasto **expected 2028**

Technologist in Video Game & Interactive Environment Development — SENA **2025 – 2028**

Coursework: data structures, algorithms, OOP, databases, software architecture

LANGUAGES

Spanish (native) · **English** (bilingual; C1 certified at 11) · **Portuguese** (advanced) · **Mandarin** (elementary, studying)

Open to internship, junior, research seedbed (semillero) and SENA apprenticeship contract roles — Pasto or remote.
